SAM management system

Description

The SAM Management System is a cloud-based or client-based application dedicated to managing the SAMs deployed in the field.

It enables the listing and control of deployed SAMs, managing their functions, software version, and operation window. The software can be offered as a service or installed on the client's server according to their needs. All controls are accessible via an easy-to-use and modern web interface with a graphical dashboard.

Among its functions, the system can manage:

- Secure firmware updates
- Secure configuration updates
- Secure kernel additions
- Service window operation
- Mass import of deployed and new SAM lists

The combined characteristics of the SAM Management System make it a robust management tool to address the constantly increasing demands for changes in deployed devices.

Partnumbers

- SMS - SaS (I0281)

Applications

- Public transportation.
- SAM management.

Further Characteristics

- Can reside on client premises or cloud, enabling best performance for each case
- Enables granular per SAM management
- Secure and reliable SAM Firmware and configuration update
- Configurable service window to meet operations need
- Web based dashboard
